(54) Title: METHOD AND KIT FOR HLA CLASS I TYPING

(57) Abstract

The present invention relates to methods and materials for determining the HLA Class I type of a subject, wherein group-specific sequences are used to design primer molecules which may be used in amplification protocols which accurately identify the HLA group(s) and/or allele(s) carried by the subject.

Description

Method And Kit For HLA Class I Typing

1. Introduction

The present invention relates to methods and materials for determining the HLA Class I type of a subject, wherein group-specific sequences are used to design primer molecules which may be used in amplification protocols which accurately identify the HLA group(s) and/or allele(s) carried by the subject.

2. Background Of The Invention

The Histocompatibility Locus Antigen ("HLA") Class I genes comprise three classical genes encoding the major transplantation antigens HLA-A, HLA-B, and HLA-C and seven other Class I genes of which HLA-E, HLA-F and HLA-G are probably functional genes and HLA-H, HLA-I, HLA-K and HLA-L are pseudogenes. The class I genes share a similar structure, which includes, *inter alia*, 5' → 3', a 5' untranslated flanking region; a first exon ("exon 1") having a length of approximately 73 base pairs ("bp"); a first intron ("intron 1") having a length of approximately 130 bp; a second exon ("exon 2"), having a length of approximately 250 bp; a second intron ("intron 2"), having a length of approximately 272 bp; a third exon ("exon 3"), having a length of approximately 276 bp; a third intron ("intron 3"), having a length of approximately 588 bp; and a fourth exon ("exon 4").

The HLA Class I genes are highly polymorphic among individuals. As of 1996, at least 73 alleles of HLA-A, 126 alleles of HLA-B and 35 alleles of HLA-C have been identified. This variability is of particular relevance when tissue transplantation between a donor and a host is contemplated. The histocompatibility antigens of donor and host should be as similar as possible to avoid both immune rejection of the transplanted tissue as well as graft-versus-host disease. It is therefore important to accurately identify the HLA types of donor and host. In view of the exigencies implicit in tissue transplantation, it is desirable that the typing be accomplished as efficiently as possible.

Methods for determining alleles of HLA-A, HLA-B, and HLA-C in a

patient sample have been heavily investigated because of the functional importance of these genes in transplant tissue matching and autoimmune diseases. The first tests developed used immunological methods to identify epitopes expressed by various HLA loci. These tests (e.g., the complement-dependent cytotoxicity assay described in Terasaki and McClelland, *Nature*, 204:998, (1964)) identified broad serological specificities but were not capable of distinguishing between allelic members of a group, and sometimes mis-identified groups altogether. Unfortunately, even the most accurate of such low resolution assays cannot detect and distinguish all functionally significant transplant antigens (Anasetti et al. *Hum. Immunol.*, 29:70 (1990)).

High resolution tests performed at the nucleic acid level which distinguish among alleles of each group have become the focus of recent research. Current methods of high resolution typing include the following.

The Sequence Specific Oligonucleotide Probes ("SSOP") technique, as described in United States Patent No. 5,451,512 assigned to Hoffman-La Roche, Inc., uses a reverse dot blot format, wherein HLA-A probes are immobilized on a membrane, and the labelled target (patient sample) DNA is hybridized to the membrane-bound probe (as described in Saiki et al., 1989, *Proc. Natl. Acad. Sci.* 86:6230-6234). The pattern of hybridization to the probes on the dot-blot gives information regarding the HLA type of the individual. However, because hybridization is inherently not sufficiently specific to rule out minor differences in sequence between probe and patient sample, there is a possibility that the patient sample may contain an allelic variant which is not accounted for.

Another nucleic acid-based test is the Amplification Refractory Mutation System (ARMS) as described in the "HLA Class I SSP ARMS-PCR Typing Kit" Reference Manual, June 1995 edition, published by the Imperial Cancer Research Fund. This assay is based on the need for complementarity (matching) between the 3' end of an amplification primer and a target DNA sequence. Absent such matching, the primer will not function properly and no fragment will be amplified. Sequence information is deduced by determining, for various pairs of primers acting on target DNA from a patient sample, whether or not a fragment is successfully amplified. The accuracy of the technique is limited by the number of

primer pairs tested and by the possibility that allelic variations exist in regions of DNA which lie between the primers.

In order to overcome the foregoing shortcomings, it has been proposed that typing be accomplished by direct DNA sequencing (Santamaria et al., "HLA Class I Sequence-Based Typing" Hum. Immunol. 37, 39-50 (1993); WO 9219771; US Pat. 5,424,184). However, while direct sequencing of a patient's Class I HLA locus may conceptually be the most accurate, such sequencing may require a time-frame unsuitable for clinical practice. The success of direct sequencing methods may be expected to rely upon the design of efficient protocols and relevant primer sequences.

Prior to the present invention, direct sequencing protocols have exhibited a number of disadvantages. For example, the method of Santamaria et al., *supra*, fails to provide sufficient information because it focuses on cDNA (exon) sequences which, in view of exon sequence diversity, offer a very limited selection of conserved primer hybridization sites. In addition, because the Santamaria sequencing primers hybridize within an exon, they do not provide information for DNA sequence upstream of the primer which is potentially decisive for distinguishing among alleles. Further, the sites disclosed were determined before the recent discovery of dozens of more alleles that now need to be considered in identifying HLA type.

Intron sequences could provide the preferred hybridization sites for amplification and sequencing primers for the HLA-A, HLA-B and HLA-C genes because they may provide the DNA sequence of the full exon. Intron sequences for an HLA Class I gene were disclosed at least as early as 1985 (Weiss et al Immunobiol 170:367-380, (1985)). Due to their substantial diversity, and the difficulties in sequencing, few intron sequences have been published subsequently.

A number of researchers have made limited use of intron based oligonucleotides for limited aspects of HLA Class I typing.

Blasczyk et al. (Tissue Antigens 1996: 47: 102-110) used exon based amplification primers to determine group specificity. After amplification, universal sequencing primers located in intron 2 were used to sequence the amplified fragment. The paper does not disclose any intron sequence motifs from intron 1 or 3 or the 5'

untranslated region.

Cereb et al. (Tissue Antigens 1995: 45:1-11), undertook the identification of intron sequences useful for locus-specific amplification primer sets for all Class I genes. These primer sets were designed to amplify all alleles of the same locus. No group specific amplification primers were sought or reported. Further, amplified fragments were characterized by SSOP and not by direct sequencing.

Johnston-Dow et al (Poster Presentation: 1995 ASHI Meeting, Dallas, TX) presented a system for direct sequence determination of HLA-A wherein degenerate exon based primers were used to amplify exons 1 to 5 of the genomic HLA-A DNA sequence. As in Cereb et al., supra, the degenerate primer pool was designed to amplify all alleles of the HLA-A locus. Group specificity was not sought or reported. Further, sequencing of the amplified fragment was obtained using a degenerate primer mix wherein primers hybridize to intron regions flanking exons 2 and 3.

A rational approach to typing of classical HLA Class I loci would provide a simplified series of steps for high resolution typing of each allele of each loci in a patient sample using intron based oligonucleotides. Further, this method would be able to identify new alleles without ambiguities.

3. Summary Of The Invention

The present invention relates to materials and methods for high-resolution, nucleic acid-based typing of the three classical HLA Class I genes (comprising the loci HLA-A, HLA-B and HLA-C) in a patient sample. It is based, in part, on the discovery of group-specific sequence motifs, derived from the analysis of numerous patient samples, which include sequences of the 5' flanking region, intron 1, intron 2, and intron 3. Such sequence motifs may be used to design amplification primers which may be used to identify the HLA group or type of a subject. The invention is also based, in part, on the determination of numerous allele-specific sequences which may be used to confirm the precise allelic type of a subject.

The present invention provides for substantially purified nucleic acids which are capable of selectively hybridizing with group specific sequence motifs in untranslated regions of the HLA-A, HLA-B or HLA-C gene loci. Such nucleic acids, which may be comprised in a kit, may be used, alone or in conjunction with exon-based primers, to determine the group specificity of HLA-A, HLA-B, or HLA-C alleles contained in a patient sample and to identify the specific alleles present.

In particular embodiments, the present invention provides for methods of ascertaining the HLA Class I type of a subject which comprise performing a first amplification reaction which identifies the group type of the subject, and a second amplification reaction which produces allele-specific nucleic acids for sequencing.

3.1. Definitions

"Allele" means one of the alternative forms of the gene in question;

"Amplification" means the process of increasing the relative abundance of one or more specific genes or gene fragments in a reaction mixture with respect to the other genes. A method of amplification which is well known by those skilled in the art is the polymerase chain reaction (PCR) as described in United States Patents Nos. 4,683,194, 4,683,195 and 4,683,202, which are incorporated herein by reference. The PCR process involves the use of pairs of primers, one for each complementary strand of the duplex DNA (wherein the coding strand is referred to as the "sense strand" and its complementary strand is referred to as the "antisense strand"), that will hybridize at a site located near a region of interest in a gene. Chain

extension polymerization (without a chain terminating nucleotide) is then carried out in repetitive cycles to increase the number of copies of the region of interest many times. The amplified oligonucleotides are then separated from the reaction mixture and used as the starting sample for the sequencing reaction. Gelfand et al. have described a thermostable enzyme, "Taq polymerase," derived from the organism *Thermus aquaticus*, which is useful in this amplification process (see United States Patent Nos. 5,352,600 and 5,079,352 which are incorporated herein by reference);

"Group" as used herein, refers to a subset of alleles of one loci, all of which share sequence features which distinguish them from other groups. For example, serological group reactivity (in a lymphocytotoxicity assay) is the conventional basis for nomenclature of HLA alleles. The first two digits of an allele refer to the serological group; for example, the designation A*0201, A*0202, A*0217 all are members of the A2 group. Further, typically the nomenclature refers to the serological split group (e.g., A23 and A24 are serological splits of A9;

"Group-specific sequence motif" means a generally short, 1-25 nucleotide ("nt") sequence of nucleic acid which is found only in one or a few groups. Where a motif is shared by several groups in one region of the HLA locus, group-specific sequence motifs in other regions of the locus may serve as group-distinguishing features. The motif may share one or more nucleotides with the consensus sequence for the region;

"Haplotype" means the allele present on one chromosome;

"Heterozygote" means the presence of at least two different alleles of a gene;

"Homozygote" means the presence of a single species of allele of a gene;

"Locus" means a gene, such as HLA-A, HLA-B or HLA-C;

"Locus specific" means an event or thing associated with only one locus;

"Patient sample" means a sample collected from a patient in need of HLA typing which contains a sufficient amount and quality of nucleic acid (preferably DNA) for the performance of an amplification reaction. A nonlimiting example of a suitable source is peripheral blood lymphocytes, tissue (including cell

cultures derived therefrom, mucosal scrapes, spleen and bone marrow;

"Primer" means a polynucleotide generally of 5-50 nucleotides length which can serve to initiate a chain extension reaction;

"Sequencing" or "DNA sequencing" means the determination of the order of nucleotides in at least a part of a gene. A well known method of sequencing is the "chain termination" method first described by Sanger et al., Proc. Nat'l Acad. Sci. (USA) 74(12): 5463-5467 (1977) (recently elaborated in EP-B1- 655506, and Sequenase 2.0 product literature (Amersham Life Sciences, Cleveland) incorporated herein by reference). Basically, in this process, DNA to be sequenced is isolated, rendered single stranded, and placed into four vessels. In each vessel are the necessary components to replicate the DNA strand, which include a template-dependant DNA polymerase, a short primer molecule complementary to a known region of the DNA to be sequenced, and individual nucleotide triphosphates in a buffer conducive to hybridization between the primer and the DNA to be sequenced and chain extension of the hybridized primer. In addition, each vessel contains a small quantity of one type of optionally detectably labeled dideoxynucleotide triphosphate, *e.g.*, dideoxyadenosine triphosphate ("ddA"), dideoxyguanosine triphosphate ("ddG"), dideoxycytosine triphosphate ("ddC"), or dideoxythymidine triphosphate ("ddT"). In each vessel, each piece of the isolated DNA is hybridized with a primer. The primers are then extended, one base at a time to form a new nucleic acid polymer complementary to the isolated pieces of DNA. When a dideoxynucleotide is incorporated into the extending polymer, this terminates the polymer strand and prevents it from being further extended. Accordingly, in each vessel, a set of extended polymers of specific lengths are formed which are indicative of the positions of the nucleotide corresponding to the dideoxynucleic acid in that vessel. These sets of polymers are then evaluated using gel electrophoresis to determine the sequence.

"Specific hybridization" means hybridization of one strand of a nucleic acid to its complement.

"Target sequence" means the preferred site for specific hybridization of a primer; and

"Untranslated region" refers to a portion of an HLA locus which is not transcribed into RNA and eventually translated into protein. Examples of untranslated regions are the 5' and 3' flanking regions and intron sequences. For example, the 5' flanking region is neither transcribed nor translated, and intron sequences are transcribed but not translated.

4. Description Of The Figures

FIGURE 1 is an illustration of the principle for an HLA class I sequencing strategy. Group-specific primers are used for PCR amplification, and universal primers located in the 2nd intron are used for sequencing, regardless of the amplified group. 5'FR= 5' flanking region; 5' UTR= 5' untranslated region (-1 to -23 from the ATG start codon in exon 1).

FIGURE 2A and 2B depict, in schematic form, a method of the invention in which a cocktail of HLA-A group specific primers is used to amplify target DNA contained in a patient sample. The products of amplification are then separated electrophoretically in an agarose gel, allowing the identification, by fragment mobility, of fragments corresponding to groups A2 and A3. Primers specific for groups A2 and A3 are then used to amplify duplicate samples of target DNA in separate reactions, to produce A2 and A3 fragments which may then be sequenced using universal sequencing primers. FIGURE 2C and 2D depict a strategy wherein group type specificity is determined by reaction of aliquots of genomic DNA in separate reactions with a panel of primer pairs.

FIGURE 3 depicts the nucleic acid sequences of the HLA-A 5' flanking region in various alleles, including a consensus sequence (SEQ ID NO:1) as well as the sequences for the following alleles: A*0101 (SEQ ID NO:2); A*0301 (SEQ ID NO:3); A*1101 (SEQ ID NO:4); A*1102 (SEQ ID NO:5); A*3001 (SEQ ID NO:6); A*3002 (SEQ ID NO:7); A*3004 (SEQ ID NO:8); A*0201-11 (SEQ ID NO:9); A*0215 (SEQ ID NO:10); A*0217 (SEQ ID NO:11); A*6801 (SEQ ID NO:12); A*6802 (SEQ ID NO:13); A*6901 (SEQ ID NO:14); A*2301 (SEQ ID NO:15); A*2402 (SEQ ID NO:16); A*2403 (SEQ ID NO:17); A*2404 (SEQ ID NO:18); A*2405 (SEQ ID NO:19); A*2407 (SEQ ID NO:20); A*2501 (SEQ ID NO:21); A*2601 (SEQ ID NO:22); A*3402 (SEQ ID NO:23); A*4301 (SEQ ID NO:24).

NO:24); A*6601 (SEQ ID NO:25); A*6602 (SEQ ID NO:26); A*6603 (SEQ ID NO:27); A*2901 (SEQ ID NO:28); A*2902 (SEQ ID NO:29); A*31012 (SEQ ID NO:30); A*3201 (SEQ ID NO:31); A*3301 (SEQ ID NO:32); A*3303 (SEQ ID NO:33); A*7401 (SEQ ID NO:34); A*7402 (SEQ ID NO:36); A*7403 (SEQ ID NO:37); and A*8001 (SEQ ID NO:38).

FIGURE 4 depicts the nucleic acid sequences of HLA-A intron 1 in various alleles, including a consensus sequence (SEQ ID NO:39) as well as the sequences for the following alleles: A*0101 (SEQ ID NO:40); A*0301 (SEQ ID NO:41); A*1101 (SEQ ID NO:42); A*1102 (SEQ ID NO:43); A*3001 (SEQ ID NO:44); A*3002 (SEQ ID NO:45); A*3004 (SEQ ID NO:46); A*0201 (SEQ ID NO:47); A*0202 (SEQ ID NO:44); A*0203 (SEQ ID NO:49); A*0204 (SEQ ID NO:50); A*0205 (SEQ ID NO:51); A*0206 (SEQ ID NO:52); A*0207 (SEQ ID NO:53); A*0207 (SEQ ID NO:54); A*0208 (SEQ ID NO:55); A*0209 (SEQ ID NO:56); A*0210 (SEQ ID NO:57); A*0211 (SEQ ID NO:58); A*0215 (SEQ ID NO:59); A*0217 (SEQ ID NO:60); A*6801 (SEQ ID NO:61); A*6802 (SEQ ID NO:62); A*6901 (SEQ ID NO:63); A*2301 (SEQ ID NO:64); A*2402 (SEQ ID NO:65); A*2403 (SEQ ID NO:66); A*2404 (SEQ ID NO:67); A*2405 (SEQ ID NO:68); A*2407 (SEQ ID NO:69); A*2501 (SEQ ID NO:70); A*2601 (SEQ ID NO:71); A*3402 (SEQ ID NO:72); A*6601 (SEQ ID NO:73); A*6602 (SEQ ID NO:74); A*6603 (SEQ ID NO:75); A*4301 (SEQ ID NO:76); A*2901 (SEQ ID NO:77); A*2902 (SEQ ID NO:78); A*3101 (SEQ ID NO:79); A*3201 (SEQ ID NO:80); A*3301 (SEQ ID NO:81); A*3303 (SEQ ID NO:82); A*7401 (SEQ ID NO:83); A*7402 (SEQ ID NO:84); A*7403 (SEQ ID NO:85); and A*8001 (SEQ ID NO:86).

FIGURE 5 depicts the nucleic acid sequences of HLA-A intron 2 in various alleles, including a consensus sequence (SEQ ID NO:87) as well as sequences for the following alleles: A*0101 (SEQ ID NO:88); A*0201 (SEQ ID NO:89); A*0202 (SEQ ID NO:90); A*0203 (SEQ ID NO:91); A*0204 (SEQ ID NO:92); A*0205 (SEQ ID NO:93); A*0206 (SEQ ID NO:94); A*0207 (SEQ ID NO:95); A*0208 (SEQ ID NO:96); A*0209 (SEQ ID NO:97); A*0210 (SEQ ID NO:98); A*0211 (SEQ ID NO:99); A*0215 (SEQ ID NO:100); A*0217 (SEQ ID NO:101);

A*6801 (SEQ ID NO:102); A*6802 (SEQ ID NO:103); A*6901 (SEQ ID NO:104); A*2501 (SEQ ID NO:105); A*2601 (SEQ ID NO:106); A*4301 (SEQ ID NO:107); A*6601 (SEQ ID NO:108); A*6602 (SEQ ID NO:109); A*6603 (SEQ ID NO:110); A*3402 (SEQ ID NO:111); A*2901 (SEQ ID NO:112); A*2902 (SEQ ID NO:113); A*3101 (SEQ ID NO:114); A*3201 (SEQ ID NO:115); A*3301 (SEQ ID NO:116); A*3303 (SEQ ID NO:117); A*7401 (SEQ ID NO:118); A*7402 (SEQ ID NO:119); A*7403 (SEQ ID NO:120); A*2301 (SEQ ID NO:121); A*2402 (SEQ ID NO:122); A*2403 (SEQ ID NO:123); A*2404 (SEQ ID NO:124); A*2405 (SEQ ID NO:125); A*2407 (SEQ ID NO:126); A*0301 (SEQ ID NO:127); A*1101 (SEQ ID NO:128); A*1102 (SEQ ID NO:129); A*3001 (SEQ ID NO:130); A*3002 (SEQ ID NO:131); A*3004 (SEQ ID NO:132); and A*8001 (SEQ ID NO:133).

FIGURE 6 depicts the nucleic acid sequences of HLA-A intron 3 in various alleles, including a consensus sequence (SEQ ID NO:134) as well as sequences for the following alleles: A*0101 (SEQ ID NO:135); A*0301 (SEQ ID NO:136); A*1101 (SEQ ID NO:137); A*1102 (SEQ ID NO:138); A*3001 (SEQ ID NO:139); A*3002 (SEQ ID NO:140); A*3004 (SEQ ID NO:141); A*0201 (SEQ ID NO:142); A*0202 (SEQ ID NO:143); A*0203 (SEQ ID NO:144); A*0204 (SEQ ID NO:145); A*0205 (SEQ ID NO:146); A*0206 (SEQ ID NO:147); A*0207 (SEQ ID NO:148); A*0208 (SEQ ID NO:149); A*0209 (SEQ ID NO:150); A*0210 (SEQ ID NO:151); A*0211 (SEQ ID NO:152); A*0215 (SEQ ID NO:153); A*0217 (SEQ ID NO:154); A*6801 (SEQ ID NO:155); A*6802 (SEQ ID NO:156); A*6901 (SEQ ID NO:157); A*2301 (SEQ ID NO:158); A*2402 (SEQ ID NO:159); A*2403 (SEQ ID NO:160); A*2404 (SEQ ID NO:161); A*2405 (SEQ ID NO:162); A*2407 (SEQ ID NO:163); A*2501 (SEQ ID NO:164); A*2601 (SEQ ID NO:165); A*3402 (SEQ ID NO:166); A*4301 (SEQ ID NO:167); A*6601 (SEQ ID NO:168); A*6602 (SEQ ID NO:169); A*6603 (SEQ ID NO:170); A*2901 (SEQ ID NO:171); A*2902 (SEQ ID NO:172); A*3101 (SEQ ID NO:173); A*3201 (SEQ ID NO:174); A*3301 (SEQ ID NO:175); A*3303 (SEQ ID NO:176); A*7401 (SEQ ID NO:177); A*7402 (SEQ ID NO:178); A*7403 (SEQ ID NO:179); and A*8001 (SEQ ID NO:180).

5. Detailed Description Of The Invention

The present invention relates to compositions and methods which may be used to efficiently and accurately determine the HLA Class I type of a patient sample.

The present invention is based, in part, on the determination of group-specific sequence motifs in regions of HLA Class I loci. These motifs may be used to design oligonucleotides which may be used as group-specific primers in nucleic acid amplification reactions. The present invention is also based, in part, on the determination of the sequences of regions of a wide variety of alleles of HLA Class I loci; such sequences may be used to distinguish one allele from another. Sequences of regions including the 5' flanking region of HLA-A and introns 1, 2 and 3 of HLA-A are provided herein, and are set forth in Figures 3-6.

In general, the methods of the invention may be described as follows. Comparison of nucleotide sequences of an HLA locus among members of an HLA Class I group, which lie in either untranslated or exon regions, may be used to identify group-specific motif sequences. Identification of groups may be by establishing serological relationships or using phylogenetic information, as set forth in Figures 7-9. Based on the group-specific motif sequences, oligonucleotide primers may be designed, synthesized, and used to amplify a portion of the HLA locus. Oligonucleotides used in this manner are referred to herein as "group-specific

primers" and, in particular, as "group-specific untranslated region primers" or "group-specific exon region primers", as the case may be.

In preferred nonlimiting embodiments of the invention, the primers correspond to untranslated regions of the HLA Class I locus ("group-specific untranslated region primers"). Such primers may be used in pairs, wherein each member of the pair hybridizes to an untranslated region lying on either side of at least one exon. For example, but not by way of limitation, primer pairs may be oligonucleotide pairs which hybridize to group-specific motifs in the 5' untranslated region and the first, second, or third intron; the first intron and the second or third intron; or the second and third intron.

The group-specific primers may be used in several different methods according to the invention. In a first series of nonlimiting embodiments, the group-specific primers may be used in a diagnostic manner to identify which allelic groups are present in a patient sample. In a second series of nonlimiting embodiments, the group-specific primers may be used to amplify sufficient amounts of a particular allelic fragment which is then subjected to direct nucleotide sequencing using universal sequencing primers.

According to the first series of embodiments, the present invention provides for a method of determining the HLA Class I group type of a subject comprising (i) combining a group-specific primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the amplification; wherein the ability of a primer pair to produce a nucleic acid product is associated with a particular HLA group type. The group-specific primers may be group-specific exon region primers or group-specific untranslated region primers. In related embodiments the present invention provides for a method of determining the HLA Class I group type of a subject comprising (i) combining a plurality of group-specific exon region primer pairs with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; (ii) determining the size of the nucleic acid products of the amplification; and (iii) correlating the size of the product with the predicted size of a fragment associated

with a particular HLA group type. The plurality of primers is referred to as an HLA "cocktail" (see Figures 1 and 2). These first methods may be used to provide useful diagnostic information. For example, group type determination may serve as a first level of comparison for a histocompatibility analysis, even without identification of the specific allele(s) involved. For example, if a potential donor and host are being evaluated for tissue transplantation, if it is found that their group types do not match, no further comparison may be necessary. If, alternatively, their types do match, further analysis, for example by direct sequencing, may be desirable.

According to the second series of embodiments, the present invention provides for a method of determining the HLA Class I allelic type of a subject comprising (i) combining a group-specific oligonucleotide primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; (ii) collecting the nucleic acid product of the amplification; and (iii) determining the nucleic acid sequence of the product. The group-specific primer pair used may be determined based on the group type of the subject, as determined using the first method, described above. In preferred embodiments of the invention, group-specific untranslated region primers which span a region of the HLA locus containing allele-specific sequence may be utilized. If a subject is heterozygous, separate amplification reactions are performed for each group identified (e.g., separate reactions to amplify fragment for group A2 and group A3; see Figure 2). Sequencing may be performed using universal sequencing primers which will operate irrespective of HLA group or allelic type.

A more detailed description of the invention follows. Most alleles of the classical HLA Class I gene loci (consisting of HLA-A, HLA-B and HLA-C) can be distinguished on the basis of exon 2 and 3 alone. In one non-limiting embodiment, a method of the invention takes advantage of this fact, and employs the strategy generally described in Figure 2, using the example of HLA-A. A genomic DNA sample is prepared from a patient sample according to well known techniques. Aliquots of the genomic DNA may then separately be reacted with a panel of group-specific exon region primer pairs (Figure 2C), wherein the successful amplification of a DNA fragment is associated with a particular group type. Alternatively, as depicted

in Figure 2A), part of the sample may be treated with a cocktail of group-specific exon region primer pairs. Each primer pair in the cocktail will amplify only selected allelic groups because they specifically hybridize to group specific intron sequence motifs. Between them, under suitable polymerase chain reaction (PCR) conditions, the cocktail may amplify all known HLA-A groups, with each group specific amplification product having a different length. When reaction products are separated on an agarose gel the group(s) present in the patient sample may be identified by length.

Optionally, once the group specificity is determined, the direct sequence of alleles may be determined for precise allelic identification. As illustrated in Figure 2 B), a further part of the patient sample DNA may be treated under PCR conditions with a pair of primers that are specific for the previously determined group; preferably such primers are group-specific untranslated region primers, which span greater distances of the locus. If two groups were detected, then two separate reactions are performed. At completion of the second amplification, the reaction products are sequenced using an intron based "universal primer" which hybridizes to an intron sequence which is conserved among all alleles of the locus. Though it is theoretically possible to use a sequencing primer which is specific for the amplified group only, it is found that using a universal primer simplifies the method and the preparation of a kit. Various universal sequencing primers are specifically provided herein (see *infra*) which hybridize, respectively, to intron sequences flanking the 5' end of exon 2, the 3' end of exon 2, the 5' end of exon 3 and the 3' end of exon 3.

The substantial advantage of the method of the invention is that the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The separation of the haplotypes is a major achievement of this protocol since it permits the resolution of cis/trans linkages of heterozygote sequencing results which cannot be achieved with other protocols. With the instant invention, a separation of the haplotypes may be achieved in serological heterozygous samples with the sequencing primer mixes ("PMs") described in Table 2 (*infra*) using group-specific amplification corresponding to the serological families. The selection of the PMs used for sequencing depends on the amplification patterns of the preceding

PCR-SSP low-resolution typing. The primers are designed to work with a in a single cycle protocol including, but not limited to, a PCR protocol on a Perkin Elmer System 9600, maintaining typing capacities of the laboratory. All PCR products carry sufficient sequence information for a complete subtyping. This approach is superior to a typing system using a single pair of generic primers followed by direct sequencing or SSO hybridization, even if the amplification strategy is locus-specific. The substantial advantage of Sequence Based Typing (SBT) is the definition of the cis/trans linkage of sequence motifs. SBT after generic PCR amplification cannot define the cis/trans linkage of sequence motifs and therefore mimics oligotyping. The rapidly growing number of newly identified alleles confirms that new alleles have arisen mainly from gene conversion events which have usually taken place between different alleles of the same locus. Newly identified alleles are not characterized by new sequence motifs, but by a new combination of already existing sequence motifs. From this observation it may be concluded that the amount of alleles at each locus may theoretically represent all possible combinations of known sequence motifs. Of course, some of them will fall victim to negative selection. Nevertheless, it can be expected that still an enormous amount of alleles are yet unidentified. PCR-SSP subtyping strategies using a restricted number of oligonucleotides which do not cover all possible sequence motifs suffer from this limitation. If the cis/trans linkage of the analyzed polymorphic regions is not defined some new alleles may be mistyped as a heterozygous combination of known alleles. This has consequences with respect to SBT strategies. An unambiguous typing result of SBT after generic PCR amplification is only unambiguous with regard to the presently known HLA sequence databank. However, with the detection of new alleles this result can become ambiguous over the course of time. This observation has already been made in PCR based DRB1 typing during the last five years and will probably also occur in PCR based class I typing. Considering the above points, the idea of the instant SBT approach is not only to identify the HLA-A, HLA-B and HLA-C subtypes, but to cover as many of the polymorphic sites as possible and to define the cis/trans linkage of the polymorphic sequence motifs. Typing results obtained with this method will remain unambiguous independently of the growing HLA sequence databank.

SUBSTITUTE SHEET (rule 26)

In general, group-specific primers are desirably designed to facilitate hybridization to their intended targets. It should be taken into account that homology between different groups, and indeed between group-specific motifs, may exist. Accordingly, in preferred embodiments of the invention, a primer may be designed such that it hybridizes to its group target under relatively stringent conditions. For example, one or more mismatched residues may be engineered into the 3' domain of the molecule. Further, the primer may be designed such that it differs from any naturally occurring or consensus sequence, but rather has mismatches inserted which serve to further reduce hybridization of the primer to target DNA of a group other than the intended target group. Under certain circumstances, one or more mismatches may be introduced into the 5' end to destabilize internal hairpin loops; such changes are not generally expected to enhance the efficiency of the primer.

The following nucleic acid sequences may be comprised in group-specific untranslated region primers for HLA-A which are specific for the groups as indicated in Table 1.

The sequences in Table 1 have the following sequence identifiers: Il-210 is SEQ ID NO:35 and the remaining sequences Il-230m through I3-282 have SEQ ID NO:181-202, respectively.

The present invention provides for nucleic acid molecules comprising regions having the foregoing sequences or their functional equivalents.

"Functional equivalents" of a nucleotide sequence, as defined herein, refers to nucleotide sequences which, when contained in a nucleic acid molecule, retain the specificity of the disclosed sequence and/or hybridize to the complement of the disclosed sequence under stringent hybridization conditions (*e.g.*, .1 x SSC at 65°C).

In specific nonlimiting examples, oligonucleotides comprising the above sequences, or functional equivalents thereof which retain specificity, may be used in a PCR amplification reaction in the following pairwise combinations to generate group specific fragments of the lengths as indicated in Table 2.

SUBSTITUTE SHEET (rule 26)

The following nucleic acid sequences may be comprised in group-specific exon region primers for HLA-A which are specific for the groups as indicated in Table 3 (sense primers) and Table 4 (antisense primers). The present invention provides for nucleic acid molecules comprising regions having the foregoing sequences or their functional equivalents. They may, in specific nonlimiting examples, be used in pairs as set forth in Table 5. The sequences in Table 3, primer numbers 85, 118, 120, 123, 127, 129, 134, 137, 140, 160, 167, 175, 193 and 202 have SEQ ID NO:203-216, respectively. The sequences in Table 4, primer numbers 98, 115, 116, 117, 126, 133, 135, 136, 138, 142, 144, 145, 152, 153, 154, 155, 161, 165, 168 and 180, have SEQ ID NO:217-236, respectively, and primer number 119 has SEQ ID NO:245.

SUBSTITUTE SHEET (rule 26)

In general, the foregoing group-specific primers may be modified by addition, deletion, or substitution of bases, to produce functionally equivalent primers with the substantially the same specificity, that is to say, such that the group specific polymorphism(s) are not removed. Such modifications may be constrained by several parameters. First, exact matching at the 3' end is particularly important for primer extension. Preferably, at least 5 nt are complementary to target DNA. When the exactly conserved region is short, for example, less than 10 nt, it is not advisable to change the primer sequences. The primer is preferably less than 50% G or C. Also, the primers should be designed to avoid specific hybridization with pseudogenes or non-classical HLA Class I loci. In the examples which follow, the melting temperature of all primers used was about 62C to ensure uniform amplification conditions.

For sequencing purposes, the following nucleic acid sequences are sequences which hybridize to all alleles of the indicated loci, in the locations indicated (and hence are referred to as universal sequencing primers).

The primers in Table 6 are assigned, consecutively, SEQ ID NO: 237-

244.

The foregoing three groups of primers include 5' and 3' primers for sequencing across exons 2 and 3, respectively.

The selection of suitable universal sequencing primers is constrained by a variety of rules including the following. Sequencing primer hybridization sites must lie within the fragment amplified by the group specific amplification primers. All primers are desirably selected to provide informative sequence and not start too far downstream of useful sequence. Preferred primers hybridize to conserved sites near the exon/intron boundaries.

Direct sequencing of the 2nd and 3rd exon may be performed from either the 5' or 3' end using the primers of Table 6 *supra* which are located in conserved regions of the 1st, 2nd and 3rd intron as indicated. These conserved regions were found to be identical in all samples investigated, regardless of the amplified group.

An important issue of direct sequencing for HLA class I genes is the generation of a specific PCR product, which is rather complicated due to the

SUBSTITUTE SHEET (rule 26)

extensive sequence homologies between the different HLA class I loci including several pseudogenes. If an adequate PCR product has been generated, any sequencing chemistry should be applicable.

In the normal case, since group specific amplifications take place before sequencing, only one allele at a time is sequenced, resulting in unambiguous homozygous sequencing results. In these cases alleles are relatively easy to identify, even without software.

However, in about 5% of cases, both alleles come from the same group, but the sequence results show heterozygosity. In practice, when viewed by a fluorescence-detecting system, the sample appears as a normal sequence of bases with, sporadically, two bases at one site, each with half the peak height. This result flows from the high degree of similarity shared among all alleles of each HLA gene; sequence heterozygosity flows from base substitutions. The laborious task of determining which alleles are present in the test sequence may be simplified using computer analysis. A software program called GeneLibrarian developed by Visible Genetics, the assignee of the present application, rapidly compares the test sequence to a database which includes all possible homozygote and heterozygote combinations of the alleles. The program identifies those stored sequences that are closest matched to the test sequence. The operator can then determine which allelic pair is in the test sample. If no allelic pair shows an exact match, the software allows the operator to review the test sequence to determine if errors in base-calling or other artifacts are interfering with the analysis.

The order of sequencing reactions may be selected by the operator. Each exon of each locus may be sequenced on the sense strand or anti-sense strand. A preferred method is to obtain sequence from one strand from each exon. If the results contain ambiguities, then the amplicon is re-sequenced using the other primer for the same exon. The availability of both sequencing primers provides redundancy to ensure robust results.

In some cases, it may be advantageous to employ an equimolar mixture of 2 or more oligonucleotide species. Mixtures of oligonucleotides may be selected such that between them they will effectively prime the sequencing reactions for all

alleles of the locus at the same site.

In an alternative technique, instead of using dye terminators, a dye-labelled primer may be employed. In this case, the selected sequencing primers is labelled on the 5' end with a detectable label, using phosphoramidite or NHS/dye ester techniques well known in the art. The label selected depends on the detection instrument employed. The label for use with an OpenGene System (Visible Genetics Inc., Toronto, ON) is the fluorophore Cy5.5 (Amersham Life Sciences, Cleveland OH). Fluorescein-isothio-cyanate may be used for detection with the ALF Automated Sequencer (Pharmacia, Piscataway NJ). In this method, which is well known to one skilled in the art, the sequencing reaction mixture is changed slightly to include only one ddNTP per reaction mixture. For detection of reaction products, the sample may be mixed with an equal volume of loading buffer (5% ficoll plus a coloured dye). 1.5 ul of these samples may be loaded per lane of a MicroCel electrophoresis cassette loaded in a MicroGene Blaster automated DNA sequencer (Visible Genetics Inc., Toronto). The sample may be electrophoresed and read.

Results may be displayed and analyzed with GeneObjects software. The sequence of bases may be determined, and the HLA allele to which the sequence corresponds may then be identified. This process may be performed for each locus (HLA-A, HLA-B, HLA-C) and the results may then be reported to the patient file.

It is well known in the art that different variations of sequencing chemistry may be employed with different automated DNA sequencing instruments. Single dye instruments, such as the OpenGene System (Visible Genetics Inc., Toronto), the ALF Express (Pharmacia, Uppsala, Sweden) or the Li-Cor 4000L (Lincoln City, Nebraska) generally use dye-labeled primers. In these systems a single chain termination sequencing reaction mixture is run per lane.

Multi-dye sequencers, such as the Prism 377 (Applied Biosystems, Inc., Foster City, California) detect multiple dyes in a single lane. This technology conveniently employs dye-terminator chemistry, where the chain-terminating nucleotides are themselves labeled with fluorophores (see United States Patent No. 5,332,666, to Dupont de Nemours and Co.). In this case, the reaction products carrying four different labels may be run in a single lane.

Either single dye or multi-dye chemistry may be employed according to the present invention, along with other sequencing chemistries. Additional methods for reducing the numbers of reactions required to obtain detailed sequence information from the classical HLA Class I loci are disclosed in commonly owned United States Patent Applications USSN 08/577,858 (for single-track sequencing) and USSN 08/640,672 and 08/684,498 (for single-tube sequencing), incorporated by reference herein.

The nucleic acids described above may be comprised in a kit for use in practicing the methods of the invention. In addition to the group-specific primers and primer pairs disclosed, such kits may further comprise buffers, reagents, and enzymes such as, amplification enzymes including but not limited to, *Taq* polymerase. In specific, non-limiting embodiments, the kit may comprise group-specific exon region primers (for example, as a "cocktail" comprising a plurality of primers) as well as group-specific untranslated region primers; such primers may be contained in individual tubes.

6. Example: Determination Of HLA-A Group Type

Genomic DNA was prepared from patient samples according to standard methods, such as a standard salting-out procedure (as provided by the Puregene DNA Isolation Kit, Gentra Systems, Inc., Minneapolis) or by detergent and proteinase K treatment (Current Protocols in Molecular Biology, Eds. Ausubel, F.M. et al, (John Wiley & Sons; 1995)).

All primers were synthesized on a Gene Assembler plus (Pharmacia, Uppsala, Sweden), and purified by fast protein liquid chromatography. The sequence, length, melting temperature (T_m), group specificity localization of the primers are given in Tables 3 (sense primers), 4 (antisense primers) and 5 (primer pairs). Internal positive control primers were: 5' primer hGHI 5'GCC TTC CCA ACC ATT CCC TTA 3', 21mer, $T_m=64^\circ\text{C}$, nucleotide position 5560-5580; 3' primer hGHI 5' TCC ATG TCC TTC CTG AAG CA 3', 20mer, $T_m=60^\circ\text{C}$, nucleotide position 6614-6633. These control primers amplify a 1074 bp fragment of the human growth hormone gene.

Group-specific identification was performed as follows. Aliquots of

genomic DNA were separately reacted with a panel of 24 group-specific exon region primer pairs set forth in Table 5, *supra* (see Blasczyk et al., 1995, Tissue Ant. 46:86-95). An amplification cocktail for pairs of primers was prepared in 10 μ l volume using standard 10x Perkin-Elmer buffer (1x buffer: 50 mM KCl; 1.5 mM MgCl₂; 10 mM Tris-HCl, pH 8.3; 0.001% (w/v) gelatin) supplemented with 5% glycerol and 0.1 μ l Cresol-red, sodium salt (Cresol-red stock solution: 10 mg/ml). The use of glycerol and cresol red avoids the necessity of using an agarose gel loading buffer. Additionally, glycerol increases the PCR yield.

The PCR mix for a single SSP tube was as follows:

Genomic DNA 100 ng	=	1.00 μ l
Taq polymerase, 0.4 U	=	0.08 μ l
dNTPs, 10 mM	=	0.80 μ l
Buffer, 10x	=	1.00 μ l
Glycerol	=	0.50 μ l
Cresol red 10mg/ml	=	0.10 μ l
dH ₂ O	=	1.52 μ l
Primer Pair + Control		
Primer Pair	=	5.00 μ l
Total		10.00 μ l

The PCR solution was prepared in volumes that would accommodate 30 reactions. The amount of primers used in each 10 μ l PCR volume was 3 pmol of each HLA-A primer and 0.8 pmol of each internal control primer.

The reaction mixture was mixed well, then heated in a Thermo-Cycler 9600 (Perkin-Elmer, Inc) and subjected to the following protocol. After an initial denaturation, a first round with 10 two-temperature cycles was followed by 20 three-temperature cycles.

- 1) Initial denaturation at 95°C for 5 min.
- 2) First 10 cycles
 - i) Denaturation at 95°C for 30 sec.
 - ii) Annealing and extension at 65°C for 50 sec.
- 3) Last 20 cycles
 - i) Denaturation at 95°C for 30 sec.
 - ii) Annealing at 62°C for 50 sec.
 - iii) Extension at 72°C for 30 sec.

SUBSTITUTE SHEET (rule 26)

The reaction tube was then cooled on ice. For visualization, 8 ul of the amplification product were run on a 2 % agarose gel prestained with ethidium bromide (0.2 ug/ml). The results were compared to a control lane with known size markers. The reaction products were visualized either as two bands (alleles from different groups) or a single band (alleles from same group). The size of the band(s) were determined and group specificity was assigned according to the length assignments in Table 5.

Figures 10 and 11 show typical gel results, which, as shown in Tables 10 and 11, were interpreted to determine what group specificities were present in genomic DNA samples tested. In Tables 7 and 8, the column titled "Position" refers to the primer mix no. of Table 5.

SUBSTITUTE SHEET (rule 26)

7. Example: Determination Of Group Specificity Using A Primer Cocktail

Group specific low-resolution typing of the patient sample may be performed as follows. First, a stock PCR amplification reaction mixture may be prepared for 30 reactions:

	<u>μl</u>
dNTPs 10mM	24
Glycerol 100%	15
10x PCR Buffer*	30
Cresol-red (10mg/ml)	3.0
H ₂ O	<u>45</u>
final	117

*1 X PCR Buffer comprises 10 MM Tris-HCl pH 8.3, 50 mM KCl, 1.5 mM MgCl₂ and 0.001% (w/v) gelatin.

The stock mixture may be prepared in a large volume and be stored for at least one month at 4°C or be aliquoted (117.0 μl) and stored at -30°C for at least six months. Repeated thawing and freezing should be avoided.

A mixture containing all the HLA-A group specific amplification primers listed in Table 5 may be prepared separately (the "Cocktail"). One member of each primer pair is labelled on the 5' end with a fluorescent label. Final Cocktail concentrations may be designed to provide 3 pmol of each HLA-A primer per 5 μl. Optionally, an internal control primer may be added (to determine among other things, the success of amplification) in the amount of 0.8 pmol per 5 ul. Suitable internal control primers amplify a 1074 bp fragment of the human growth hormone gene (see *supra*).

To perform the low resolution amplification reaction, the reaction mixture may be prepared as follows:

	Volume
Stock Mixture	5 μ l
Cocktail	5 μ l
Patient sample DNA 100-250 ng	1 μ l
Taq Polymerase Enzyme 0.4 U	0.08 μ l

PCR cycle parameters may be adjusted for a Perkin-Elmer System 9600 thermal cycler. After an initial denaturation, a first round with 10 two-temperature cycles may be followed by 20 three-temperature cycles: 1) Initial Denaturation at 95°C for 5 min; 2) First 10 cycles i) Denaturation at 95°C for 30 seconds and ii) Annealing and extension at 65°C for 50 seconds; 3) Last 20 cycles i) Denaturation at 95°C for 30 seconds, ii) Annealing at 62°C for 50 seconds and iii) Extension at 72°C for 30 seconds.

The reaction tube may then be cooled on ice. For visualization, 2 μ l of the amplification product may be run on a polyacrylamide gel giving single nucleotide length resolution such as in a MicroGene Blaster. The results were compared to a control lane with known size markers. The reaction products may be visualized either as two bands (alleles from different groups) or a single band (alleles from same group). The size of the band(s) may be determined and group specificity may be assigned according to the length assignments in Table 5.

8. Example: Determination Of Allelic Type By Sequencing

After determining group type specificity, group specific amplification of a fresh portion of the patient sample may be performed using a single pair of primers specific for the group in question to generate sequencing template. In a preferred, nonlimiting embodiment, amplification primers may be selected from Table 2, *supra*, which lists group-specific untranslated region primers. This second amplification serves two purposes. First, it confirms, by successful amplification, the group determination of the low resolution test. Second, it generates sequence information which may be used for accurate allele identification. If two groups are identified, two separate reactions may be performed each using a different primer pair.

8.1. PCR Protocol

The same PCR protocol may be used for all primer mixes used for template generation. The PCR amplification may be set up in a total volume of 50 μ l in order to produce enough PCR product for more than 10 sequencing reactions. This ensures that, if anything fails during the sequencing process, sequencing can be repeated without generation of a new template. The high stringency of the PCR primers and protocol detailed below makes the use of a "hot start approach" unnecessary. The following PCR reaction mix may be used:

	<u>volume per reaction</u>
5X PCR buffer*	10.0 μ l
DMSO	1.0 μ l
2.5mM each dNTP	5.0 μ l
ddH ₂ O	<u>27.8μl</u>
Total	43.8 μ l
Sense primer** (10pmol/ μ l)	1.0 μ l
Antisense primer** (10pmol/ μ l)	1.0 μ l
Taq Polymerase (5U/ μ l)	0.2 μ l
Genomic DNA (100ng/ μ l)	<u>4.0μl</u>
Final Total	50.0 μ l

*Composition of 5X PCR buffer: 75mM (NH₄)₂SO₄; 17.5mM MgCl₂; and 300mM Tris-HCL, pH 9.0

**The pair of group specific amplification primers may be selected from those disclosed in Table 2, *supra*.

PCR cycle parameters may be adjusted for a Perkin-Elmer System 9600 thermal cycler. After an initial denaturation, a first round with 10 two-temperature cycles may be followed by 20 three-temperature cycles.

- 1.) Initial Denaturation at 95 C for 5 min
- 2.) First 10 cycles
 - i) Denaturation at 95 C for 30 seconds
 - ii) Annealing and extension at 65 C for 50 seconds
- 3.) Last 20 cycles
 - i) Denaturation at 95 C for 30 seconds
 - ii) Annealing at 62 C for 50 seconds
 - iii) Extension at 72 C for 30 seconds

10 μ l of the PCR product may then be run on a 2 % agarose gel prestained with ethidium bromide (0,2 μ g/ml). A distinct band of the expected size should be seen.

8.2. Sequencing Reaction Protocol

The sequencing reactions may be carried out with AmpliTaqTM DNA Polymerase FS dye terminator cycle sequencing chemistry using the Ready Reaction DyeDeoxy Terminator Cycle Sequencing Kit FS (Perkin Elmer Applied Biosystems

Division, Foster City, CA) according to the manufacturer's protocol. This Kit contains the four ddNTPs with different fluorescence labels (=Dye Terminators). The PCR fragments may be used directly for sequencing without any prior purification step.

To simplify the pipetting steps, a master mix may be prepared consisting of the 5'Biotin labeled sequencing primer, ddH₂O and the Kit reagents. This master mix should be prepared immediately prior to use and can be kept at room temperature until use. The sequencing master mix for one reaction may comprise 3.0 μ l of a 1pmol/ μ l solution of sequencing primer; 6.0 μ l ddH₂O, and 8.0 μ l of premixed sequencing reagents; for 36 + 1 reactions, these amounts are increased, respectively, to 111.0 μ l; 222.0 μ l; and 296.0 μ l, respectively. The sequencing primer may be selected from the sequencing primers for HLA-A set forth in Table 6, *supra*.

The master mix may be aliquoted in a volume of 17 μ l for each sequencing reaction in a 200 μ l PCR tube and 3 μ l of the unpurified PCR product are added. The reaction mixes may then be subjected to 25 cycles in a Perkin Elmer thermal cycler 9600. Each cycle consists of 10 sec 95 C, 5 sec 50 C and 4 min 60 C.

8.3. Purification Of Extension Products

After the sequencing reaction the extension products are desirably separated from the unincorporated Dye Terminators which would otherwise interfere with the fluorescence-based detection process of the electrophoretically separated sequencing fragments.

For each sequencing reaction, 50 μ g (5 μ l) Streptavidin-coated Dynabeads M-280 (Dynal Inc., Oslo, Norway) may be washed in 5 μ l of 2x Binding and Washing buffer ("B&W"; 2X B&W buffer: 2M NaCl, 10mM Tris-HCl pH 7.5, 1mM EDTA). The beads may then be resuspended in 20 μ l of 2x B&W.

To each 20 μ l sequencing reaction, 20 μ l of resuspended beads may be added, and the mixture may be incubated at room temperature (20-25 C) for 15 minutes. The beads may then be immobilized, the supernatant may be removed, and then the beads may be washed once in 70% ethanol by pipetting up and down five times. Then, as much as possible of the ethanol may desirably be removed, because residual ethanol may interfere with electrophoretic gel mobility.

For each sequencing reaction, 4 μ l of loading buffer (5:1 Formamide-

25mM EDTA pH 8.0, 50mg/ml Dextran Blue) may be added.

8.4. Electrophoresis And Data Collection

Samples prepared by the foregoing methods may be used immediately or be stored at 4 C at least for 24 hours before starting the electrophoretic separation. Prior to the electrophoretic separation, each reaction may be incubated at 90 C for 2 minutes. 3 μ l of each sample may be loaded on a prerun sequencing gel. For an automated ABI 377 sequencer (Applied Biosystems, Foster City, CA) a 0.2mm thick 5% polyacrylamide (acrylamide:bisacrylamide = 29:1) - 7 M urea gel may be used [gel composition: 21.0 g urea, 8.4 ml 30% acrylamide (stock solution: 58g acrylamide, 2g bisacrylamide in bidistilled water), 6.0 ml TBE buffer (10x TBE-buffer: 108.0 g tris base, 55.0 g boric acid, 7.4 g Na₂EDTA), 15 μ l TEMED, 350 μ l 10% Ammoniumpersulfate (1.0 g Ammoniumpersulfate in 10 ml ddH₂O), 20.0 ml ddH₂O]. Electrophoresis may be run at constant 48 watt for 8h. Data collection may be initiated immediately after starting the electrophoresis on the ABI377. Data analyses may be performed thereafter using the ABI analysis software (version 2.1.1).

8.5. Data Interpretation And HLA Typing

After data collection, the chromatograms may be printed and sequences may be compared manually to existing HLA data in the EMBL databank and the sequences compiled by Arnett and Parham. Due to the group-specific amplification and the lack of heterozygous positions, manual analysis is typically very fast. Alternatively, sequences may be checked with the data analysis editor (Sequence NavigatorTM, Applied Biosystems) and aligned with any sequence alignment program.

(2) INFORMATION FOR SEQ ID NO:192:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 20 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear
 - (ii) MOLECULE TYPE: genomic DNA
 - (iii) HYPOTHETICAL: no
 - (iv) ANTI-SENSE: no
 - (v) ORIGINAL SOURCE:
 - (A) ORGANISM: human
 - (ix) FEATURE:
 - (A) NAME/KEY: 5FR-273

SUBSTITUTE SHEET (rule 26)

WHAT IS CLAIMED IS:

1. A method of determining the HLA Class I group type of a subject comprising the following steps:

(i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and

(ii) determining whether a nucleic acid product is produced by the amplification;

wherein the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type.

2. The method of claim 1, wherein the HLA Class I group to be determined is part of the HLA-A locus.

3. The method of claim 1, further comprising the step of (iii) determining the nucleic acid sequence of the nucleic acid product of step (ii).

4. The method of claim 1, wherein the primer pair comprises one or more oligonucleotide primers selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO: 184), I1-214m (SEQ ID NO: 185), I1-223d (SEQ ID NO: 186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202).

5. The method of claim 1, wherein the primer pair is selected from the group of pairs consisting of I1-230m (SEQ ID NO:181) and BP142 (SEQ ID NO:195); 5'FR-257 (SEQ ID NO:191) and I3-247m6 (SEQ ID NO:199); I1-230m (SEQ ID NO:181) and I3-247m6 (SEQ ID NO:199); I1-226 (SEQ ID NO:182) and I3-249 (SEQ ID NO:200); I1-221m11 (SEQ ID NO:183) and I3-280m18 (SEQ ID

NO:201); 5'FL-243 (SEQ ID NO:190) and I3-249 (SEQ ID NO:200); I1-214m (SEQ ID NO:185) and I3-249 (SEQ ID NO:200); I1-210m (SEQ ID NO:35) and I3-236 (SEQ ID NO:196); I1-210m (SEQ ID NO:35) and I3-249 (SEQ ID NO:200); 5'FR-273 (SEQ ID NO:192) and I3-249 (SEQ ID NO:200); I1-223d (SEQ ID NO:186) and I3-239 (SEQ ID NO:197); I1-223d (SEQ ID NO:186) and I3-249 (SEQ ID NO:200); I1-240 (SEQ ID NO:189) and I3-249 (SEQ ID NO:200); I1-237m14 (SEQ ID NO:188) and I3-249 (SEQ ID NO:200); I1-225m (SEQ ID NO:187) and I3-249 (SEQ ID NO:200); BP202 (SEQ ID NO:193) and I3-249 (SEQ ID NO:200) and BP203 (SEQ ID NO:194) and I3-282 (SEQ ID NO:202).

6. A method of determining the HLA Class I allele type of a subject comprising the following steps:

(i) combining a group-specific exon region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur;

(ii) determining whether a first nucleic acid product is produced by the amplification wherein the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type, and thereby identifying the group type;

(iii) combining a group-specific untranslated region primer pair corresponding to the group type of the subject, as determined by steps (i)-(ii), with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur and a second nucleic acid product is produced; and

(iv) determining the nucleic acid sequence of the second nucleic acid product collected in step (iii).

7. The method of claim 6, wherein the HLA Class I allele to be determined is part of the HLA-A locus.

8. The method of claim 6, wherein the group-specific exon region primer pair used in step (i) comprises one or more oligonucleotide primers selected

from the group consisting of primers 85 (SEQ ID NO:203), 118 (SEQ ID NO:204), 120 (SEQ ID NO:205), 123 (SEQ ID NO:206), 127 (SEQ ID NO:207), 129 (SEQ ID NO:208), 134 (SEQ ID NO:209), 137 (SEQ ID NO:210), 140 (SEQ ID NO:211), 160 (SEQ ID NO:212), 167 (SEQ ID NO:213), 175 (SEQ ID NO:214), 193 (SEQ ID NO:215), 202 (SEQ ID NO:216), 98 (SEQ ID NO:217), 115 (SEQ ID NO:218), 116 (SEQ ID NO:219), 117 (SEQ ID NO:220), 119 (SEQ ID NO:245), 126 (SEQ ID NO:221), 133 (SEQ ID NO:222), 135 (SEQ ID NO:223), 136 (SEQ ID NO:224), 138 (SEQ ID NO:225), 142 (SEQ ID NO:226), 144 (SEQ ID NO:227), 145 (SEQ ID NO:228), 152 (SEQ ID NO:229), 153 (SEQ ID NO:230), 154 (SEQ ID NO:231), 155 (SEQ ID NO:232), 161 (SEQ ID NO:233), 165 (SEQ ID NO:234), 168 (SEQ ID NO:235) and 180 (SEQ ID NO:236).

9. The method of claim 6, wherein the group-specific exon region primer pair used in step (i) is selected from the group of pairs consisting of 140 (SEQ ID NO:211) and 142 (SEQ ID NO:226); 85 (SEQ ID NO:203) and 98 (SEQ ID NO:217); 140 (SEQ ID NO:211) and 126 (SEQ ID NO:221); 167 (SEQ ID NO:213) and 168 (SEQ ID NO:235); 118 (SEQ ID NO:204) and 119 (SEQ ID NO:245); 129 (SEQ ID NO:208) and 115 (SEQ ID NO:218); 129 (SEQ ID NO:208) and 116 (SEQ ID NO:219) and 117 (SEQ ID NO:220); 160 (SEQ ID NO:212) and 135 (SEQ ID NO:223); 118 (SEQ ID NO:204) and 133 (SEQ ID NO:222); 118 (SEQ ID NO:204) and 145 (SEQ ID NO:228); 134 (SEQ ID NO:209) and 155 (SEQ ID NO:232); 134 (SEQ ID NO:209) and 136 (SEQ ID NO:224); 118 (SEQ ID NO:204) and 161 (SEQ ID NO:233); 118 (SEQ ID NO:204) and 154 (SEQ ID NO:231); 120 (SEQ ID NO:205) and 152 (SEQ ID NO:229); 193 (SEQ ID NO:215) and 180 (SEQ ID NO:236); 127 (SEQ ID NO:207) and 165 (SEQ ID NO:234); 137 (SEQ ID NO:210) and 145 (SEQ ID NO:228); 175 (SEQ ID NO:214) and 115 (SEQ ID NO:218) and 116 (SEQ ID NO:219); 167 (SEQ ID NO:213) and 144 (SEQ ID NO:227); 167 (SEQ ID NO:213) and 133 (SEQ ID NO:222); 137 (SEQ ID NO:210) and 138 (SEQ ID NO:225); 202 (SEQ ID NO:216) and 153 (SEQ ID NO:230); and 140 (SEQ ID NO:211) and 136 (SEQ ID NO:224).

10. The method of claim 6, wherein the group-specific untranslated region primer pair used in step (iii) comprises one or more oligonucleotide primers selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO:184), I1-214m (SEQ ID NO:185), I1-223d (SEQ ID NO:186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202).

11. The method of claim 6, wherein the group-specific untranslated region primer pair used in step (iii) is selected from the group of oligonucleotide primer pairs consisting of I1-230m (SEQ ID NO:181) and BP142 (SEQ ID NO:195); 5'FR-257 (SEQ ID NO:191) and I3-247m6 (SEQ ID NO:199); I1-230m (SEQ ID NO:181) and I3-247m6 (SEQ ID NO:199); I1-226 (SEQ ID NO:182) and I3-249 (SEQ ID NO:200); I1-221m11 (SEQ ID NO:183) and I3-280m18 (SEQ ID NO:201); 5'FL-243 (SEQ ID NO:190) and I3-249 (SEQ ID NO:200); I1-214m (SEQ ID NO:185) and I3-249 (SEQ ID NO:200); I1-210m (SEQ ID NO:35) and I3-236 (SEQ ID NO:196); I1-210m (SEQ ID NO:35) and I3-249 (SEQ ID NO:200); 5'FR-273 (SEQ ID NO:192) and I3-249 (SEQ ID NO:200); I1-223d (SEQ ID NO:186) and I3-239 (SEQ ID NO:197); I1-223d (SEQ ID NO:186) and I3-249 (SEQ ID NO:200); I1-240 (SEQ ID NO:189) and I3-249 (SEQ ID NO:200); I1-237m14 (SEQ ID NO:188) and I3-249 (SEQ ID NO:200); I1-225m (SEQ ID NO:187) and I3-249 (SEQ ID NO:200); BP202 (SEQ ID NO:193) and I3-249 (SEQ ID NO:200) and BP203 (SEQ ID NO:194) and I3-282 (SEQ ID NO:202).

12. A method of determining the HLA Class I allele type of a subject comprising the following steps:

(i) combining a plurality of group-specific exon region primer pairs

with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur and a first nucleic acid product is produced;

(ii) determining the size of the first nucleic acid product of the amplification;

(iii) correlating the size of the first nucleic acid product with the predicted size of a fragment associated with a particular HLA type;

(iv) combining a group-specific untranslated region primer pair corresponding to the group type of the subject, as determined by steps (i)-(iii), with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur and a second nucleic acid product is produced; and

(v) determining the nucleic acid sequence of the second nucleic acid product.

13. The method of claim 12, wherein the HLA Class I allele to be determined is part of the HLA-A locus.

14. The method of claim 12, wherein the plurality of group-specific exon region primer pairs used in step (i) comprises one or more oligonucleotide primers selected from the group consisting of primers 85 (SEQ ID NO:203), 118 (SEQ ID NO:204), 120 (SEQ ID NO:205), 123 (SEQ ID NO:206), 127 (SEQ ID NO:207), 129 (SEQ ID NO:208), 134 (SEQ ID NO:209), 137 (SEQ ID NO:210), 140 (SEQ ID NO:211), 160 (SEQ ID NO:212), 167 (SEQ ID NO:213), 175 (SEQ ID NO:214), 193 (SEQ ID NO:215), 202 (SEQ ID NO:216), 98 (SEQ ID NO:217), 115 (SEQ ID NO:218), 116 (SEQ ID NO:219), 117 (SEQ ID NO:220), 126 (SEQ ID NO:221), 133 (SEQ ID NO:222), 135 (SEQ ID NO:223), 136 (SEQ ID NO:224), 138 (SEQ ID NO:225), 142 (SEQ ID NO:226), 144 (SEQ ID NO:227), 145 (SEQ ID NO:228), 152 (SEQ ID NO:229), 153 (SEQ ID NO:230), 154 (SEQ ID NO:231), 155 (SEQ ID NO:232), 161 (SEQ ID NO:233), 165 (SEQ ID NO:234), 168 (SEQ ID NO:235) and 180 (SEQ ID NO:236).

15. The method of claim 12, wherein the plurality of group-specific exon region primer pairs used in step (i) comprises one or more oligonucleotide primer pairs selected from the group of pairs consisting of 140 (SEQ ID NO:211) and 142 (SEQ ID NO:226); 85 (SEQ ID NO:203) and 98 (SEQ ID NO:217); 140 (SEQ ID NO:211) and 126 (SEQ ID NO:221); 167 (SEQ ID NO:213) and 168 (SEQ ID NO:235); 118 (SEQ ID NO:204) and 119 (SEQ ID NO:245); 129 (SEQ ID NO:208) and 115 (SEQ ID NO:218); 129 (SEQ ID NO:208) and 116 (SEQ ID NO:219) and 117 (SEQ ID NO:220); 160 (SEQ ID NO:212) and 135 (SEQ ID NO:223); 118 (SEQ ID NO:204) and 133 (SEQ ID NO:222); 118 (SEQ ID NO:204) and 145 (SEQ ID NO:228); 134 (SEQ ID NO:209) and 155 (SEQ ID NO:232); 134 (SEQ ID NO:209) and 136 (SEQ ID NO:224); 118 (SEQ ID NO:204) and 161 (SEQ ID NO:233); 118 (SEQ ID NO:204) and 154 (SEQ ID NO:231); 120 (SEQ ID NO:205) and 152 (SEQ ID NO:229); 193 (SEQ ID NO:215) and 180 (SEQ ID NO:236); 127 (SEQ ID NO:207) and 165 (SEQ ID NO:234); 137 (SEQ ID NO:210) and 145 (SEQ ID NO:228); 175 (SEQ ID NO:214) and 115 (SEQ ID NO:218) and 116 (SEQ ID NO:219); 167 (SEQ ID NO:213) and 144 (SEQ ID NO:227); 167 (SEQ ID NO:213) and 133 (SEQ ID NO:222); 137 (SEQ ID NO:210) and 138 (SEQ ID NO:225); 202 (SEQ ID NO:216) and 153 (SEQ ID NO:230); and 140 (SEQ ID NO:211) and 136 (SEQ ID NO:224).

16. The method of claim 12, wherein the group-specific untranslated region primer pair used in step (iv) comprises one or more oligonucleotide primers selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO:184), I1-214m (SEQ ID NO:185), I1-223d (SEQ ID NO:186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ

ID NO:202).

17. The method of claim 12, wherein the group-specific untranslated region primer pair used in step (iv) is selected from the group of oligonucleotide primer pairs consisting of I1-230m (SEQ ID NO:181) and BP142 (SEQ ID NO:195); 5'FR-257 (SEQ ID NO:191) and I3-247m6 (SEQ ID NO:199); I1-230m (SEQ ID NO:181) and I3-247m6 (SEQ ID NO:199); I1-226 (SEQ ID NO:182) and I3-249 (SEQ ID NO:200); I1-221m11 (SEQ ID NO:183) and I3-280m18 (SEQ ID NO:201); 5'FL-243 (SEQ ID NO:190) and I3-249 (SEQ ID NO:200); I1-214m (SEQ ID NO:185) and I3-249 (SEQ ID NO:200); I1-210m (SEQ ID NO:35) and I3-236 (SEQ ID NO:196); I1-210m (SEQ ID NO:35) and I3-249 (SEQ ID NO:200); 5'FR-273 (SEQ ID NO:192) and I3-249 (SEQ ID NO:200); I1-223d (SEQ ID NO:186) and I3-239 (SEQ ID NO:197); I1-223d (SEQ ID NO:186) and I3-249 (SEQ ID NO:200); I1-240 (SEQ ID NO:189) and I3-249 (SEQ ID NO:200); I1-237m14 (SEQ ID NO:188) and I3-249 (SEQ ID NO:200); I1-225m (SEQ ID NO:187) and I3-249 (SEQ ID NO:200); BP202 (SEQ ID NO:193) and I3-249 (SEQ ID NO:200) and BP203 (SEQ ID NO:194) and I3-282 (SEQ ID NO:202).

18. A composition comprising a plurality of oligonucleotide primer pairs comprising one or more primers selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO:184), I1-214m (SEQ ID NO:185), I1-223d (SEQ ID NO:186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202).

19. A composition comprising an oligonucleotide primer selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO:184), I1-

214m (SEQ ID NO: 185), I1-223d (SEQ ID NO: 186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202).

20. A composition comprising an oligonucleotide primer pair selected from the group consisting of I1-230m (SEQ ID NO:181) and BP142 (SEQ ID NO:195); 5'FR-257 (SEQ ID NO:191) and I3-247m6 (SEQ ID NO:199); I1-230m (SEQ ID NO:181) and I3-247m6 (SEQ ID NO:199); I1-226 (SEQ ID NO:182) and I3-249 (SEQ ID NO:200); I1-221m11 (SEQ ID NO:183) and I3-280m18 (SEQ ID NO:201); 5'FL-243 (SEQ ID NO:190) and I3-249 (SEQ ID NO:200); I1-214m (SEQ ID NO:185) and I3-249 (SEQ ID NO:200); I1-210m (SEQ ID NO:35) and I3-236 (SEQ ID NO:196); I1-210m (SEQ ID NO:35) and I3-249 (SEQ ID NO:200); 5'FR-273 (SEQ ID NO:192) and I3-249 (SEQ ID NO:200); I1-223d (SEQ ID NO:186) and I3-239 (SEQ ID NO:197); I1-223d (SEQ ID NO:186) and I3-249 (SEQ ID NO:200); I1-240 (SEQ ID NO:189) and I3-249 (SEQ ID NO:200); I1-237m14 (SEQ ID NO:188) and I3-249 (SEQ ID NO:200); I1-225m (SEQ ID NO:187) and I3-249 (SEQ ID NO:200); BP202 (SEQ ID NO:193) and I3-249 (SEQ ID NO:200) and BP203 (SEQ ID NO:194) and I3-282 (SEQ ID NO:202).

21. A kit comprising:

(a) a plurality of oligonucleotide group-specific untranslated region primer pairs comprising one or more primers selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO: 184), I1-214m (SEQ ID NO: 185), I1-223d (SEQ ID NO: 186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID

NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202); and

(b) an enzyme for nucleotide chain extension.

22. A kit comprising:

(a) an oligonucleotide group-specific untranslated region primer selected from the group consisting of I1-210m (SEQ ID NO:35), I1-230m (SEQ ID NO:181), I1-226 (SEQ ID NO:182), I1-221m11 (SEQ ID NO:183), I1-209 (SEQ ID NO:184), I1-214m (SEQ ID NO:185), I1-223d (SEQ ID NO:186), I1-225m (SEQ ID NO:187), I1-237m14 (SEQ ID NO:188), I1-240 (SEQ ID NO:189), 5'FL-243 (SEQ ID NO:190), 5'FR-257 (SEQ ID NO:191), 5'FR-273 (SEQ ID NO:192), BP202 (SEQ ID NO:193), BP203 (SEQ ID NO:194), BP142 (SEQ ID NO:195), I3-236 (SEQ ID NO:196), I3-239 (SEQ ID NO:197), I3-246 (SEQ ID NO:198), I3-247m6 (SEQ ID NO:199), I3-249 (SEQ ID NO:200), I3-280m18 (SEQ ID NO:201) and I3-282 (SEQ ID NO:202); and

(b) an enzyme for nucleotide chain extension.

23. The kit of claim 22, further comprising:

(c) a cocktail comprising group-specific exon region primers comprising one or more primer selected from the group consisting of 85 (SEQ ID NO:203), 118 (SEQ ID NO:204), 120 (SEQ ID NO:205), 123 (SEQ ID NO:206), 127 (SEQ ID NO:207), 129 (SEQ ID NO:208), 134 (SEQ ID NO:209), 137 (SEQ ID NO:210), 140 (SEQ ID NO:211), 160 (SEQ ID NO:212), 167 (SEQ ID NO:213), 175 (SEQ ID NO:214), 193 (SEQ ID NO:215), 202 (SEQ ID NO:216), 98 (SEQ ID NO:217), 115 (SEQ ID NO:218), 116 (SEQ ID NO:219), 117 (SEQ ID NO:220), 126 (SEQ ID NO:221), 133 (SEQ ID NO:222), 135 (SEQ ID NO:223), 136 (SEQ ID NO:224), 138 (SEQ ID NO:225), 142 (SEQ ID NO:226), 144 (SEQ ID NO:227), 145 (SEQ ID NO:228), 152 (SEQ ID NO:229), 153 (SEQ ID NO:230), 154 (SEQ ID NO:231), 155 (SEQ ID NO:232), 161 (SEQ ID NO:233), 165 (SEQ ID NO:234), 168 (SEQ ID NO:235) and 180 (SEQ ID NO:236).

24. A kit comprising:

(a) an oligonucleotide primer pair selected from the group consisting of

I1-230m (SEQ ID NO:181) and BP142 (SEQ ID NO:195); 5'FR-257 (SEQ ID NO:191) and I3-247m6 (SEQ ID NO:199); I1-230m (SEQ ID NO:181) and I3-247m6 (SEQ ID NO:199); I1-226 (SEQ ID NO:182) and I3-249 (SEQ ID NO:200); I1-221m11 (SEQ ID NO:183) and I3-280m18 (SEQ ID NO:201); 5'FL-243 (SEQ ID NO:190) and I3-249 (SEQ ID NO:200); I1-214m (SEQ ID NO:185) and I3-249 (SEQ ID NO:200); I1-210m (SEQ ID NO:35) and I3-236 (SEQ ID NO:196); I1-210m (SEQ ID NO:35) and I3-249 (SEQ ID NO:200); 5'FR-273 (SEQ ID NO:192) and I3-249 (SEQ ID NO:200); I1-223d (SEQ ID NO:186) and I3-239 (SEQ ID NO:197); I1-223d (SEQ ID NO:186) and I3-249 (SEQ ID NO:200); I1-240 (SEQ ID NO:189) and I3-249 (SEQ ID NO:200); I1-237m14 (SEQ ID NO:188) and I3-249 (SEQ ID NO:200); I1-225m (SEQ ID NO:187) and I3-249 (SEQ ID NO:200); BP202 (SEQ ID NO:193) and I3-249 (SEQ ID NO:200) and BP203 (SEQ ID NO:194) and I3-282 (SEQ ID NO:202); and

(b) an enzyme for nucleotide chain extension..

25. The kit of claim 24, further comprising:

(c) a cocktail comprising group-specific exon region primers

comprising one or more primer selected from the group consisting of 85 (SEQ ID NO:203), 118 (SEQ ID NO:204), 120 (SEQ ID NO:205), 123 (SEQ ID NO:206), 127 (SEQ ID NO:207), 129 (SEQ ID NO:208), 134 (SEQ ID NO:209), 137 (SEQ ID NO:210), 140 (SEQ ID NO:211), 160 (SEQ ID NO:212), 167 (SEQ ID NO:213), 175 (SEQ ID NO:214), 193 (SEQ ID NO:215), 202 (SEQ ID NO:216), 98 (SEQ ID NO:217), 115 (SEQ ID NO:218), 116 (SEQ ID NO:219), 117 (SEQ ID NO:220), 126 (SEQ ID NO:221), 133 (SEQ ID NO:222), 135 (SEQ ID NO:223), 136 (SEQ ID NO:224), 138 (SEQ ID NO:225), 142 (SEQ ID NO:226), 144 (SEQ ID NO:227), 145 (SEQ ID NO:228), 152 (SEQ ID NO:229), 153 (SEQ ID NO:230), 154 (SEQ ID NO:231), 155 (SEQ ID NO:232), 161 (SEQ ID NO:233), 165 (SEQ ID NO:234), 168

(SEQ ID NO:235) and 180 (SEQ ID NO:236).

(b) an enzyme for nucleotide chain extension..

26. The kit of claim 25, further comprising:

(d) a sequencing primer selected from the group consisting of 5'-

EX2(Aw3) 5' GCG GCG GGA GGA GGG TC 3' (SEQ ID NO:237), 3'-Ex2 5' ATC
TCG GAC CCG GAG ACT 3' (SEQ ID NO:238), 5' GTT TCA TTT TCA GTT TAG
